Career Pivot Coach

Agentica hackathon build report · 31 October 2026 · Live: **https://career-pivot-coach.vercel.app**

336	22	36 / 36	81	5
real job postings read (Naukri)	role families mapped	automated tests passing	clicks in the live click census, 0 errors	independent reviews, all findings fixed

1. The brief, item by item

Hackathon asks for	What the coach does	Status
Résumé and target-role intake	Paste or speak (Wispr Flow) experience; picks a role from 22 chips or free text. Goal sentences ("I want to become…") and context words ("worked with sales") are not counted as skills.	Done
Skill-gap map from real job descriptions	Per-role share of postings that list each skill, "signature" skills (2× more common in this role than the market), source links to the actual postings, entry-level share. Roles without data say so instead of guessing.	Done
Week-by-week learning plan	One main gap a week (signature skills first), top two gaps get a learn + apply week, hours split to fit the weekly budget exactly, capstone week, a free resource per skill.	Done
Portfolio projects matched to gaps	24 project templates; greedy pick of the 3 that close the most demand-weighted gaps (e.g. "CI/CD pipeline from commit to cloud" for DevOps).	Done
Mock interviews scored on a rubric	STAR structure, specificity (numbers, incl. "a fifth"), relevance (related tools count), ownership, length; 0–100 with "how to raise it".	Done
Progress tracking that adjusts the plan	Mark done / slipped: a slipped week repeats; an interview score under 60 adds a review week; progress bar.	Done
Application tracker that learns which roles reply	Smoothed reply rate and lift per closeness-to-target, source, work model and tailored résumé; advice only from groups of 3+; example data shown separately until 3 real entries.	Done

Principle used throughout: **AI interprets. Rules validate. You approve.** Every number on the page is counted from postings, not generated by a model.

2. Research and data

- **Source:** Naukri.com search pages, read 31 Oct 2026 with Firecrawl structured extraction (tags copied as printed, never inferred). About 110 Firecrawl credits in total; JobsPipe (20 credits for 1 result) and JobDataLake (broken session) were tried and dropped.
- **Roles (22):** business, data, product, operations, supply-chain and financial analyst; data scientist; Python, Java and full-stack developer; DevOps; software test engineer; product, project and program manager; UI/UX and graphic designer; content writer; digital marketing; HR recruiter; business development; customer success.
- **"Training":** employer tags are normalised through a 117-skill synonym table (e.g. Power BI = BI tools; Tally/GST/ledger = accounting), filler tags are removed ("Development", "End to end"), and each role's profile is compared with the whole market to find its signature skills.
- Random sample of source links opened in a browser: live postings.

3. How it is built

Layer	Choice and why
Frontend	One HTML page, no framework; matches the portfolio site (Inter, black hero, mint accent, ruled lists). Sticky section nav, phone-first, 44px targets, focus rings, reduced-motion support.
Backend	Python standard library only (no dependencies). Stateless API `/api/coach`: each visitor's plan lives in their own browser, so many people can use it with no database and no shared data.
Deployment	Vercel project `career-pivot-coach`; static page + one Python function. A build script copies only public files; engine and data are bundled privately (direct URLs return 404).
AI layer	`/pivot-coach` Claude Code skill for deeper interview feedback and adding new roles; the live site runs fully on rules.

4. Quality: tests, census and reviews

Check	Finding	Result
Automated tests (36)	Every role distinct and cited; plan fits the weeks and hours; rubric; tampered or malformed requests never crash.	36/36 pass
Click census (live)	Both Start buttons, all 22 chips, build for every role, unknown role, done/slipped, interview, 3 applications, Start over.	81 clicks, 0 errors
Stranger review 1	"I want to be X" counted as having X; no feedback after actions.	Fixed
Stranger review 2	Accountant with Tally/GST scored 0% (goal filter deleted the sentence); STAR scoring too strict.	Fixed (now 39%)
Stranger review 3	"A stranger could use it unaided and nothing shown is false."	SHIP
UI/UX designer	7/10. Key number buried; weak chip state; identical plan weeks; low-contrast warning; inconsistent rows; context words matched as skills.	All 8 fixed (big verdict, auto-rebuild chips, progress bar, 7:1 contrast, fixed grid)
Backend developer	Malformed input → 500; error text leaked internals; "false" stored as true; engine/data publicly downloadable; hours over budget at 3–4h.	All fixed and verified live

5. Run as the target user (Aditya's own profile)

Found while using it as Aditya	Fix
"weekly KPI review", "PyTorch", "Power BI reports", "reconciled", "led the Zoho One implementation" not recognised	Added to the synonym table; Business Analyst match rose from 42% to 53%, Product Analyst 57%, Data Analyst 91%
Power BI dashboards did not count as data visualisation	"Implied skills" rule, shown as "Implied by your Business intelligence work"

"customer and vendor records" counted as Procurement; "AI prototype" as UI prototyping	Treated as context words in a person's own text
Plans had "Learn problem solving" weeks	Soft skills stay on the map ("Show in interviews") but never take a learning week
Power BI answer to a product-analytics question scored 1/5 relevance	Business intelligence counted as related; the DHL answer scores 76

Visual pass: a 7-step strip in the hero mirrors the hackathon brief; results fade in, bars grow, the match counts up on a mint card; build button shows progress; all motion is off for reduced-motion users.

---

6. Honest limits

- Coverage is 22 roles, 9–20 postings each: a strong signal, not a census of the market. New roles cost about 5 credits each.
- Skill matching is keyword-based: it only credits tools named in the text (the page says so and asks for more detail when the match is low).
- The designer's fixes were checked by script and at 375px width, not re-reviewed by the designer (saved tokens). No rate limiting on the API.
- Not done, waiting on you: import of your own 87 job-cycle postings; LinkedIn post and portfolio card (drafts in `launch/`).

---

7. Next steps

- Rehearse the demo: Fill in a sample person → Build → click another role chip → speak an interview answer with Wispr Flow.
- Say "yes" to publish the LinkedIn post and the portfolio card when the hackathon is over.

Project folder: Documents\Agentic AI Product Space · Redeploy: `python tools/build_deploy.py`, then `npx vercel@65.9.0 deploy --prod --yes` from active\deploy.
